1. Introduction

The ESNsurvey is a European-wide research project implemented by the Erasmus Student Network, covering different topics related to international student mobility, being one of the biggest student-led initiatives of its kind, it has inspired ESN’s international student representation and advocacy efforts to improve the access, experience and impact of mobility since it’s first implementation in 2005.

This XVth edition sought to increase the understanding and improve the overall mobility experience of students, and help understand the barriers students, both mobile and non-mobile students face to participate in mobility; with a focus on the supporting measures (administration, financing), and the academic and socio-cultural experience of students.

The Erasmus Student Networks aims to monitor the implementation of the Erasmus+ programme 2021-2027, by implementing three bi-yearly editions in 2023, 2025 and 2027 to track the progress of the Erasmus+ programme. Many sources were used in the design of this year’s survey, such as the ESNsurvey XIV, the SIEM research publication and the Green Erasmus research publication, as well as the Eurobarometer and the Erasmus+ participants report, in order to set the scene for the survey to track the progress made within the programme implementation period.

The survey reached out to three different target audiences - exchange students, full-degree students and non-mobile students, who were enrolled in Higher Education in the academic year of 2021-2022 and/or academic year 2022-2023. The data shows that 78.40% (n = 17.855) of participants participated in international student mobility as an exchange student, 8.15% (n = 1.856) of participants participated in international student mobility as an international full degree student, and 13.45% (n = 3.064) did not have any international experience in their higher education.
Respondents were in line with the Erasmus+ participants, with 65.22% of respondents identifying as women, 32.39% as men and 1.11% as Non-binary, with the most prominent age groups among the participants: 73.20% were aged 20 to 24, 19.07% were aged 25 to 29, and 3.15% were younger than 20. The remaining of the participants were older than 29 or preferred not to disclose their age.

Within the pool of participants, 77.01% hold citizenship in one of the 27 Member States of the EU, with the most prominent nationalities being: Italian (16.86%), German (9.06%), Spanish (8.09%), Polish (5.05%), French (4.68%), Austrian (4.49%) and Czech (3.89%). Notable representations outside the EU include 3.04% Turkish, 1.21% Indian and 0.96% British. In total, 156 distinct nationalities were recorded in the survey. 1.44% of participants preferred not to disclose their nationality.

ESNsurvey XV is a quantitative and deductive research based on an online questionnaire that was launched on the 29th of May and closed on the 31st of July 2023, constituting a collection period of 2 months for the survey. With the support of numerous stakeholders such as the European Commission, the European Parliament, National Agencies, Higher Education Institutions, Networks of Universities and European Alliances.

To highlight that this research was supported by an Expert Group composed of a diversity of organisations and institutions, such as ACA: Academic Association for Cooperation, EAIE: European Association for International Education, IAU: International Association of Universities, EUF: European University Foundation, Tilburg University and former members of the ESN and ESNsurvey contributors.

In order to increase dissemination among international students, the role of ESN members and the relationship with our external stakeholders such as Higher Education Institutions, University Networks, National Agencies and the European Commission as well as our partners at EUrail and Flixbus who provided us with prizes for the prize draws.
A dissemination package was shared in order to facilitate the promotion of the questionnaire among students, Higher Education Institutions and other stakeholders. The survey was disseminated mainly through social media (such as Instagram, Facebook, and Twitter), and direct mailing to past participants. Participants were able to access the survey via a direct link: https://esnsurvey.org/survey.

The research team however acknowledges that even though a maximum effort was placed in reaching as many students as possible to fill in the survey, the survey itself is based on a convenience sample, meaning that there might be a self-selection bias to participate in the study. For clarity during the XV ESNsurvey, the questions analysed were added in the graphs descriptions.
2. Exchange Students

2.1. Sample Characteristics

Level of study during stay aboard

Figure 1: What was/is your study level during your stay abroad?

On a total of 18089 respondents, 63.99% were studying a Bachelor's or equivalent level during their stay abroad, 32.35% were studying a Master's or equivalent level during their stay abroad, 1.31% were studying a Doctorate (PhD) or equivalent level during their stay abroad, and 2.35% other.
Duration of the exchange

Based on 17,727 responses, the most common durations of mobility were 5 months (37.36%), 6 months (16.43%), and 4 months (14.38%), showing the preference of students for one-semester mobilities.

Top 10 sending countries

Figure 2: Please, indicate the duration of your exchange

Figure 3: Select the country of your SENDING institution from the list
The 5 most common sending countries of respondents ($n = 17,926$) were Italy (17.76%), Spain (9.96%), Germany (9.62%), France (5.73%), and the Czech Republic (5.69%). Additionally, several other countries also presented high participant rates in the XV ESN survey such as Poland (5.19%), Austria (4.23%), Greece (3.47%), Romania (3.22%) and Turkey (3.15%). To provide a comparison, an analysis has been made taking into account the Erasmus + annual reports. The perception is that in the year 2020 (European Commission, 2021) the countries that sent more mobile students were Germany, Spain, France, Italy and Poland and in 2021 were France, Italy, Germany, Spain and Turkey (European Commission, 2022).

**Top 10 hosting countries**

Based on 17,926 responses, the 5 most common hosting countries of respondents were Spain (12.95%), Italy (11.58%), Germany (9.46%), France (6.43%), and Portugal (6.21%). Additionally, several other countries also presented high participant rates in the XV ESN survey such as the Czech Republic (5.24%), Belgium (4.32%), Poland (3.74%), Sweden (3.16%), Austria (2.95%).

*Figure 4: Please, choose the country of your HOST institution from the list.*
provide a comparison, an analysis has been made taking into account the Erasmus + annual reports. The perspective is that in the year 2020 (European Commission, 2021) the countries that received more mobile students were Spain, France, Germany, Italy and the United Kingdom and in 2021 were Spain, Germany, France, Italy and Poland (European Commission, 2022).

**Mobility Type**

Based on 17708 responses, the most common types of mobility were study exchange at another university (89.98%) and traineeship/internship placement at a company/organisation (6.97%). 3.05% of respondents indicated other types of mobility. This data shows the significant difference between the participation in study exchange and other mobility types presenting possible limitations in potential access to mobility opportunities even within the Erasmus + framework.
These statistics ($n=1,7704$) provide valuable insights into the prevalence and popularity of different exchange programmes among ESNsurvey participants. Erasmus+ (88.2%) continues to be the most recognised programme. A lower percentage of respondents reported participation in other exchange programmes, such as agreements between institutions (5.24%) SEMP programme (2.42%) and the Turing programme (0.60%), alongside various other programmes and mobility options mentioned by a smaller percentage of respondents.
3.2. The Priorities of the Erasmus+ Programme

The ESNsurvey XV is the first one of a set of 3 surveys monitoring the Erasmus+ programme 2021-2027. The 4 horizontal priorities are key to guiding the policy efforts done at different levels, and through the new ECHE, Higher Education Institutions have increased responsibilities to implement actions that contribute to these priorities. Gathering data on the student perspective regarding the extent to which the programme is actually delivering can help to evaluate the overall perception of the programme’s societal impact.

Looking at the results, there is a positive impact of the inclusion measures (n=14753) implemented. A significant 36% of respondents agree, while an even more substantial 46% strongly agree with these measures. Through this report, a better perception of the students regarding the topic of inclusion will be developed, especially when tackling the inclusion top-up (p. 28)

Concerning environmental sustainability (n=14752), 35% of respondents agree, and 40% strongly agree that the programme helps participants acquire sustainable skills and habits. Looking deeper into the results of the Green Erasmus research, and comparing it with the
means of transportation used by students, there is a certain gap between attitudes and practice among Erasmus students when it comes to the adoption of more environmentally sustainable habits and behaviours. (Green Erasmus Partnership, 2022)

On the topic of digitalisation (n=14751), 39% agree, and 25% strongly agree with its positive impact. Throughout this new programme, we’ve seen some significant steps toward digitalisation. However, as we’ll explore in this report, there are areas where enhancements can be made, particularly in the implementation of the Erasmus+ App—a project in which ESN is actively involved and eager to see further developments. Additionally, there are opportunities for refinement in the administration procedures related to the mobility path.

Lastly, in terms of civic engagement (n=14751), 38% agree, and 31% strongly agree with its positive influence. Despite this perception, there’s room for improvement in fostering democratic participation. Our survey shows that only 10% of students engage in volunteering activities during their Erasmus+ mobilities. To address this, there is a need for better support to students and alumni organisations on the ground, improving recognition of volunteering opportunities, and enhancements to tools like the learning agreement to better track students’ learning progress. In this way, as described in the SIEM technical recommendations “the learning agreement should also be used as a guide for self-reflection on the mobility experience, accompanied by the Erasmus+ coordinators from the sending and hosting institutions” (Erasmus Student Network, 2022). These measures can help students connect more with their local communities, a crucial aspect of programme enhancement.
2.3. Before Mobility

Motivations to go on exchange

When students were asked about their motivations for studying abroad, several factors emerged as significant drivers for international mobility. These factors give insights into the range of motivations that influence students' decisions to pursue educational experiences abroad. In what follows a short overview is provided of the different motivational categories and their importance for students. Even though the motivations for students to engage in mobility are varied, engaging with people from different cultural backgrounds (79.63%), gaining knowledge of another culture (74.94%), and learning/improving a foreign language (72.35%) score the highest in mobile students.
It is crucial to emphasise the main factors influencing participants’ choice of a specific mobility destination. Upon analysis, it becomes evident that the foremost reason is the affordability of the host city, with 36% in agreement and 30% strongly agreeing. This is closely followed by the availability of courses recognised by their home institution, where 29% agree and 37% strongly agree. Additionally, the ability to speak in the language of instruction at the destination university is significant, with 26% in agreement and 35% strongly agreeing.

Conversely, the least chosen reason for selection was the destination recommended by the sending institution, with only 13% in agreement and 11% strongly agreeing. Similarly, choosing a destination based on career prospects in the city garnered 22% agreement and 14% strong agreement. Lastly, accessibility via sustainable transportation means received support from 19% in agreement and 12% strongly agreeing.
The highest priority, indicated by 82% of respondents, was the need for information about available financial support. Tools such as the Erasmus + Grant Simulator, available in the Erasmus General Portal, can be key factors in providing the adequate support that international students need to make a well-informed decision on their mobility destination.

Furthermore, 66% of participants emphasised the significance of obtaining comprehensive programme information to make informed decisions about their study options abroad. Equally important was support throughout the application process, with 66% of respondents seeking guidance in navigating the complexities of applying for study abroad programs.

Peer-to-peer support is also highly valued, with 63% of participants desiring insights from former study abroad students. Additionally, 58% of respondents highlighted the importance of understanding the courses offered by potential host universities to align their academic goals with available offerings. While slightly lower in priority, 40% of participants expressed a need for assistance in selecting the most suitable host university. When comparing with the data
from the SIEM final report, students reported that to prepare for their mobility experience, its utmost importance to have information about available funding (94%), support with the application process (88%) and help choosing a host university (86%). (K. Allinson, Wim G., 2021).

Meeting other students and understanding the potential impact on academic performance abroad were equally important to 38% of respondents. Meeting students from the host university held slightly less importance, with 32% considering it a valuable aspect of their preparations. Finally, support in finding an internship placement received the lowest priority, with only 26% of participants deeming it important in their pre-departure preparations.

These insights provide valuable information for educational institutions to tailor their pre-departure support programs effectively to meet the diverse needs and expectations of students planning to study abroad.

2.4. During Mobility

Means of transport used for travelling during exchange

![Figure 11: What means of transport did you use for travelling at these three key moments of your exchange?](chart)

Participants were asked which means of transport they used during key moments of their mobility (n=14489). Upon reviewing the results, it becomes apparent that the most preferred
mode of transportation for travelling to the mobility destination is still the plane, with 73% of participants choosing this option, and 72% preferring it for the return journey to their home country. However, for overnight trips during their mobility, buses (42%) and trains (39%) emerge as the preferred choices.

To gain a deeper insight into the factors influencing these transportation choices, participants were asked to rank the importance of specific reasons when selecting their mode of transport, using a rating scale from 1 (most important) to 7 (least important). A total of 14,489 responses were collected, the two main reasons for choosing the means of transport are time to complete the journey with 43.3% indicating as their top priority and cost/price relation with 33% of the respondents indicating as their main priority as well.

When comparing the participants who have received the green top-up (9.56%) with the findings from the Green Erasmus report, it becomes evident that the number of participants opting for sustainable means of travel has not increased. According to the Green Erasmus Report, air travel continues to be the preferred mode of transportation among Erasmus students. The ESNsurvey reveals that 73% of participants travelled to their mobility
destinations by plane, closely aligning with the 73.1% reported in the Green Erasmus Report. Additionally, 72% of participants chose air travel as their return method of transportation, similar to the 69.8% documented in the Green Erasmus data (Green Erasmus Partnership, 2022).

As anticipated, the limited availability of the Green Travel top-up has not led to a significant rise in the use of sustainable means of travel among mobility students.

**Challenges faced by students**

Identifying the primary challenges faced by students participating in Erasmus+ is crucial for developing effective measures to support mobility throughout its various phases. The results of the XV ESNsurvey reveal several similarities with the XIV ESNsurvey and the former Erasmus+ Programme. However, when comparing both surveys, it becomes evident that the issue of insufficient funding to cover the cost of living has increased, now ranking as the top concern reported by students (35.63%). This issue is closely interlinked with the delayed
disbursement of grants and scholarships, which further emphasises the challenges, accounting for 20.11% of reported concerns.

This is closely followed by challenges related to finding affordable accommodation (35.50%), which has also seen an increase compared to previous years. The issue of accommodation has also been tackled in the Housing Survey Report, where almost half of the respondents can cover less than 50% of their accommodation costs with their scholarships. (ESU & ESN, 2023)

Problems associated with the academic courses continue to be a significant concern, with 33.97% of students reporting difficulties in this regard.

Furthermore, issues related to integrating with local students have also increased and remain significant, with 20.11% of students experiencing difficulties in this area.

Similar to the last survey, the least commonly experienced problem among students was discrimination based on personal background, which was reported by only 4.3% of respondents.

![Figure 14: The issues experienced impacted me in the following way](Image)
These problems lead students to experience feelings of anxiety and stress (42.3%). The least commonly experienced effect of the problems experienced during mobility was feelings of isolation and social exclusion, with 22.9% of respondents agreeing or strongly agreeing that the issues impacted them in this way.

Satisfaction with the Sending and Hosting Institutions

*Figure 15 & 16: Overall satisfaction with services provided by SENDING and HOSTING institution*

Regarding the services offered by Higher Education Institutions (HEIs), it’s important to highlight that students participating in Erasmus+ continue to be considerably satisfied with the services and support provided by both the hosting (n=14483) and sending institutions (n=14495). However, satisfaction with both hosting and sending Higher Education Institutions has shown a decline compared to the previous XIV ESN survey (ESN, 2021) and the last programme edition. In that survey, only 3.9% of respondents expressed being very dissatisfied with their sending institutions, while this figure has risen to 6% in the current survey. Additionally, it is noteworthy that a greater number of respondents now remain neutral about their sending institution, with the percentage increasing from 17.4% to 21%. It is equally important to highlight differences in satisfaction. In 2021, 39.9% of respondents reported
satisfaction, whereas in the current survey, this number has increased to 45%. However, the rate of those being very satisfied has decreased from 27.4% to 19%.

A similar trend is observed with satisfaction regarding services provided by host institutions. In 2021, only 2.1% of students reported being very dissatisfied with their host institutions, but this figure has risen to 6% in the 2023 survey. The dissatisfaction rate has also increased from 5.1% to 7%. Neutral responses have seen an increase from 9.4% to 14%, while the satisfaction rate remains largely unchanged. The number of students stating they are very satisfied has decreased from 43.6% to 34%.

The return after the COVID-19 pandemic and difficulties in implementing grant payments during the academic year of 2021-2022 may explain students' dissatisfaction with institutional services. Additionally, the growing housing crisis, as outlined in ESN and ESU's report, could be another contributing factor.

However, the introduction of new initiatives, such as the European Universities, may have diverted some necessary attention away from improving mobility services. Addressing this issue is crucial, as it will not only benefit mobile students but also enhance the entire student population's experience by creating a more internationally focused Higher Education environment.
**Funding of the mobility period**

Figure 17: How was your mobility period funded? Please consider "total cost" to include accommodation, travel, food and pocket money

Considering that the main problem identified by the students is “Insufficient money to cover my cost of living” (35.63%) it’s important to understand how much students are funded for their mobility experiences (n=12732). The chart above (Chart 6) illustrates the total cost covered by the scholarship for exchange students, divided into five categories. Upon analysis, the following observations are made: approximately 34.8% of students can cover between 25% and 50% of their mobility expenses, with the programme covering the rest. Around 25.4% of students have between 50% and 75% of their costs covered by the programme. 15.3% of students receive extensive financial support, with between 75% and 100% of their costs covered by the programme. 17.2% of respondents receive less than 25% of their costs covered by the scholarship. The final report of the ESN survey, will aim to compare these five categories with the programme countries in order to identify which ones offer the most financial support to international students.
Timing of the grants

![Diagram showing timing of grants]

Figure 18: When did you receive the scholarship?

Ensuring that the grants are received before the beginning of the mobility experience is fundamental to facilitating the participation of students (n=11765). Despite the visible efforts made to improve the timing of the grant payments. When compared to the findings of the previous ESN survey, it becomes evident that more students are now receiving grants within 30 days after their arrival, with an increase from 32.92% to 36.8%. However, it's worth noting that fewer students are receiving grants more than 30 days after their arrival, with a decrease from 32.92% to 25.9%. Additionally, more students are receiving grants prior to their departure, marking an increase from 32.92% to 36.8%. In this way, it is visible that ongoing efforts in this regard are showing positive results, although, there is still more to be done to ensure that all students receive their grants on time.

Furthermore, it's essential to acknowledge that national differences play a significant role, as countries like Spain (67%) tend to disburse grants one month after the start of mobility, while Germany (26%) follows a different pattern of distribution. Interestingly, a substantial percentage of students in these countries receive their grants before departure, indicating that national regulations may not be the primary barrier to advancing grant payments.
The timid improvement in the percentage of students that receive the grants before the start of the mobility shows that changes in administration at the national and institutional levels can improve the situation.

Scholarship per month

Figure 19: How much did/will you receive as a scholarship per month?

The data indicates that the average grant amount has increased significantly, now standing at nearly €100 more than what was reported in the Erasmus+ Annual Report 2020 (€374): €468. This increase can be attributed to the implementation of top-ups and grant increases by National Agencies, representing a positive development. However, it conceals substantial variations among countries, which are not always linked to differences in purchasing power but rather reflect the opacity of the grant determination system outlined in the Erasmus+ Programme guide.

Countries in South-Western Europe tend to have grant levels that approach the minimum, while Central and Eastern European countries, both in the northern and southern regions, typically enjoy higher grant levels. It’s imperative that decisions regarding national grant levels involve consultation with student organisations and other relevant stakeholders, taking into account various trade-offs and providing transparent assessments of factors like national co-financing of the programme. This transparency and collaboration should be established during the current programming period, with information on different grant levels and the decision-making process made publicly available at the European level.
Grant top-ups ($n=12239$) represent a highly welcomed improvement, offering additional financial support to students and broadening access to mobility experiences. These top-ups not only enhance mobility but also foster greater participation among students who may have fewer opportunities to engage in such opportunities, thus significantly improving the overall mobility experience for all.

Firstly, it’s important to highlight that the top-up for students with fewer opportunities has had a noteworthy impact, with 10% of students reporting that they have received one. When comparing this with the question “Erasmus + programme is inclusive of students from different backgrounds”, participants who have received the top-up, 34% agree, and 47% strongly agree, indicating a positive response to this initiative, which aligns with ESN’s endorsement and strong recommendation for its reinforcement.

However, despite efforts by the European Commission to ensure students receive the grant before embarking on their mobility, 36.8% still reported receiving the grant within 30 days after arrival, and 26% received it more than 30 days after arrival.
As for the Green top-up, as previously analysed in preferred means of transportation used by students, it appears not to have led to a substantial increase in the use of sustainable means of travel among mobility students.

It’s crucial to highlight that 15% of respondents reported not knowing whether they had received top-ups or not. This underscores the importance of providing clear financial information and effectively informing students about the new initiatives introduced under Erasmus+ to ensure that they can fully benefit from these opportunities.

**Digital tools used on mobility**

The introduction of digitalisation within Erasmus+ has been a significant and positively received innovation in the new programme. This advancement is designed to simplify administrative processes and make procedures more efficient, thereby reducing potential barriers that might deter students from participating in mobility opportunities. The qualitative section of the survey reveals that students who did not have access to online procedures expressed dissatisfaction with the administration of their mobility experience.

While analysing the data, it’s perceived that the implementation of the Online Learning Agreement (68%) has been the most successful, and the Erasmus+ App is the one facing the most necessary strengthening. It is crucial to prioritise and focus on further enhancing the
digitalisation of procedures, with specific attention given to improving the Erasmus+ App. ESN has advocated for a stronger engagement component in the rollout of the Erasmus+ App, and to use the tool to ensure the programme development.

Additionally, it’s also important to highlight, in terms of credit recognition, the development of effective solutions for these procedures online, addressing the challenges students encounter in relation to academic courses. This commitment to digital transformation has the potential to greatly improve the overall experience of Erasmus+ participants and contribute to the continued success of the programme.

2.5. After Mobility

Recognition of Credits

![Recognition of Credits Chart]

While choosing their mobility destination students consider “Matching courses which can be recognised by my home institution” (66%) as a key factor for their decision, making recognition the second most important factor, only behind the affordability of the hosting city.

In this context, it’s crucial to deep-dive into our understanding of this issue. The chart above (Chart 15) illustrates the recognition process that exchange students undergo during their

mobility period. Initially, students have an average of 33 ECTS in their Learning Agreements. Upon arrival at the host university, students typically need to make an average adjustment of 14 ECTS. On average, students successfully complete and receive credit for 30 ECTS, indicating that they usually pass all their courses during their mobility. Upon returning to their home university, the average number of recognised credits is 28 ECTS. This represents a difference of -2 credits on average, but the majority of courses taken during their exchange period are recognised.

While we will further analyse these results in the final report, and provide clarity on the regional differences on this matter, it’s important to note that 42% of the respondents revealed that their courses needed to be changed during exchange. This underscores the ongoing need to ensure automatic credit recognition for exchange students and reinforces the objectives set by the [Council Recommendation on promoting automatic mutual recognition of higher education and upper secondary education and training qualifications and the outcomes of learning periods abroad](https://eur-lex.europa.eu).

Even though on average 28 credits are recognised it’s important to highlight that 2.6% of the survey respondents did not get any of their credits recognised upon their return to their home university.

The examination of the qualitative data from the ESNsurvey provided a better understanding of the structural problems related to this issue. These problems include a lack of flexibility in degree programs, trust issues between partner universities, recognition decisions influenced by individual professors, a lack of understanding of how the ECTS system works, limited access to information about available courses, and insufficient pre-departure support for preparations related to the learning agreement.

In the same perspective, as highlighted in ESN’s Contribution to the new Learning Mobility Framework, after the evaluation of the Council Recommendation on automatic credit recognition of qualifications and learning period abroad (Council of the European Union, 2018), there is the perception that the European Credit Transfer and Accumulation System
(ECTS) is widely used around Europe, but not always in a consistent way. Although this falls under the Member States competencies it’s key for the establishment of a European Education Area by 2025 and highly relevant for the success of learners’ mobility within the Erasmus+ programme.

In order to provide more details on the matter, especially in differences between countries and regions, a more detailed analysis will be provided during the final report with a comprehensive understanding of these variations.

**Skills improved during exchange**

![Bar chart showing the top 5 skills improved during exchange](chart.png)

**Figure 23: Which skills do you believe you improved during your exchange?**

In the light of the European Year of Skills, mobile students were asked which skills they developed the most during their mobility experience. Based on 14,489 responses, the top 5
skills were Language skills (86%), Communication skills (76%), Open-Mindedness skills (75%), Social skills (69%), and Adaptability to Change (67%).

In this context, the success of the Erasmus+ programme priorities, such as facilitating language acquisition abroad and promoting intercultural awareness, is undeniably evident. Erasmus+ serves as a powerful catalyst, presenting individuals with invaluable opportunities to not only elevate their language proficiencies but also to enhance their aptitude for effective communication with individuals from diverse backgrounds. Beyond the expected educational and professional growth, Erasmus+ plays a pivotal role in fostering profound personal development, enriching the lives of its participants on multiple dimensions.

3. Full Degree Student’s

Motivations to Study Abroad

In the case of full-degree students, it is important to recognise that their motivations for studying abroad differ somewhat from those of exchange students. The primary motivation for full-degree students is to enhance their future career prospects, with a substantial 72% citing
this as their foremost objective for pursuing studies abroad. Engaging with individuals from diverse cultural backgrounds (70%) remains a popular motivation among full-degree students, closely followed by the desire to experience different learning environments (66%). Notably, the least frequently chosen motivation factor for studying abroad is "to improve my academic performance," selected by 47% of respondents. This insight provides valuable understanding into the distinct aspirations and goals of full-degree students pursuing education abroad.

Pre-departure support

![Bar chart showing pre-departure support preferences]

Figure 25: Which pre-departure support do you find important to receive?

Similar to the responses from exchange students, full-degree students have also expressed in their highest priorities regarding pre-departure support (n=8696) the importance of receiving information. Among them, "information about financial support available" stands out as the top priority, with a significant 75% of respondents emphasising its importance. Following closely behind are "information on the programme available" and "hearing from students who have studied abroad," both of which are considered vital by 61% of the respondents. The value of peer-to-peer support is also evident, with 61% of respondents expressing a desire to hear from students who have already experienced studying abroad.
On the other hand, some other aspects have received lower scores such as "information on the impact on career prospects," with 38% of respondents. "Meeting other students considering an international degree" and "support to find an internship placement" are also seen as somewhat less critical, with 37% and 36% of respondents considering them important, respectively.

**Challenges faced by students**

![Challenges faced by students](chart)

*Figure 26: Did you experience any of the following issues during your study abroad?*

This graph provides valuable insights into the challenges faced by full-degree students during their international experiences. It’s evident that they encounter both common and distinct issues compared to exchange students.

One significant challenge faced by full-degree students is finding affordable accommodation, with 43.54% highlighting this as their primary concern. Following closely is the absence of family and friends (36.94%), which can be attributed to the longer duration of their mobility experiences, making connections and support networks even more critical.
Difficulties in connecting with the local community also feature prominently as the third most common issue, with 36.60% of respondents facing this challenge. What's interesting to note is that full-degree students express lower satisfaction levels (32%) with the welcome and orientation events and initiatives provided by the host institution compared to exchange students (46%). ESN recognises these events as crucial for fostering integration and community engagement.

Another notable finding is that full-degree students encounter more difficulties with administrative processes (21.71%) compared to exchange students (10.98%). This indicates the need for improved support and guidance in navigating administrative aspects related to studying abroad.

Although problems with courses remain a concern for full-degree students, with a decrease from 21.71% to 10.98% to 21.71% compared to exchange students.

**Funding of the full-degree period**

![Bar chart showing funding distribution](image)

*Figure 27: How was your degree funded? Please consider "total cost" to include tuition fee, accommodation, travel, food and pocket money.*
Considering that full-degree students are not supported by Erasmus + grants it’s relevant to explore how they fund their mobility aboard. A closer examination of the graph reveals that 38.9% of respondents reported that their international experience was self-funded, although 21.8% of respondents stated that they received funding covering 75% to 100% of their expenses, highlighting a notable disparity in funding opportunities among full-degree students ($n=1681$).

When comparing these results with the sources of funding of exchange students ($n=1590$), using a Likert scale from 1-5, 3.9% of the average of the respondents have obtained a job during their mobility experience and 3.3% had a job before their mobility. Only 1.7% of students are using family contributions.

In the final report, it would be valuable to cross-compare these two analyses to gain a deeper understanding of how full-degree students ensure their financial sustainability during their experiences aboard.
On the topic of Recognition of Credits, it’s interesting to understand the difficulties still faced by full-degree students in getting their credits recognised ($n=1693$). Specifically on the automatic recognition of credits abroad, approximately 25% of respondents reported that the credit recognition process took less than 1 month, while 24% indicated it took between 1 to 3 months. A smaller percentage (5%) experienced delays of 3 to 5 months, and 4% faced even longer delays of over 6 months. In total, a significant 58% of full-degree respondents did not have their credits automatically recognised, indicating the need for further improvements in this area. ESN believes that automatic credit recognition should be ensured for all mobile students, and measures at the national level should be implemented to make this possible for all students.
On another note, about difficulties in the recognition of diplomas after mobility (n=1675). Only (6%) reported difficulties in their own country, while 7% encountered recognition challenges in a different country and 24% have not yet pursued degree recognition. In this way, a substantial 45% of respondents did not encounter any difficulties with degree recognition. This suggests positive progress, and good news considering the feature measures being taken into place for the implementation of the European Degree pilot project.

---

Figure 30: Did you have problems getting your Higher Education degree recognised after completing your studies?

Figure 31: Which difficulties have you encountered in the recognition of your degree?
It was inquired participants facing difficulties which problems they were facing, 70% hadn’t encountered any difficulties, 14% had problems with administration and procedures, 7% had high administration costs, 6% the degree did not meet all the conditions, 4% the degree did not exist in other countries.

These findings underscore the importance of continuing efforts to streamline credit and degree recognition processes for full-degree students, ensuring a more accessible and seamless international education experience.

4. Non-Mobile Students

**Motivational factors to go abroad**

- To learn / improve a foreign language: 72%
- To enhance my future career prospects: 46%
- To improve my academic performance: 56%
- To develop my skills related to internationalisation: 69%
- To gain knowledge of another culture: 69%
- To engage with people from different cultural backgrounds: 69%
- To build up a personal and professional network: 55%
- To become more independent / resilient: 65%
- To be able to be my true self / explore my identity: 53%
- To experience different learning environments: 60%
- Other (Please Specify): 2%

*Figure 32: Select what could be the biggest motivating factors that could be relevant in your potential decision to participate in an exchange programme*

The motivation factors for going abroad among students are quite similar across the various target audiences, including non-mobile students. The key motivation factors include learning and improving a foreign language (72%), gaining knowledge of another culture (69%), and
engaging with people from different cultural backgrounds (69%). While improving academic performance is the least chosen option among non-mobile students, it still motivates 46% of respondents to study abroad.

Additionally, while analysing the scenarios chosen by students to embark on their mobility journeys, 41% agree and 43% strongly agree on the importance of providing more information on the programmes available. Furthermore, 37% agree and 43% strongly agree that "hearing from students who have been abroad" would encourage them to participate in mobility. It’s important to note that the Erasmus+ regulation highlights the role of Erasmus+ alumni in the promotion of the programme, unfortunately, there have been very few developments on tangible measures to support these initiatives. ESN considers that new measures funded by the programme, such as an established funding mechanism distributed by NAs to national and local student and alumni organisations, could increase access to mobility.

Figure 33: Could the below scenarios have encouraged you to go abroad during your degree programme?
Initiatives from the EU

When non-mobile were enquired about students and their awareness of various EU initiatives, it became evident that Erasmus+ for studies remains the most well-known, with a remarkable 95%. This was followed by Erasmus+ Traineeships, acknowledged by 58% of respondents, and the International Credit Mobility programme, recognised by 35%.

Regrettably, initiatives such as Erasmus Mundus Joint Masters (27%), European Solidarity Corps (18%), European Universities Alliances (18%), and the Blended Intensive Programme (9%) appear to be underrepresented in the awareness of higher education students. The implementation of more comprehensive information among higher education students is necessary.

It’s important to note that both European Universities Alliances and the Blended Intensive Programme are relatively recent additions to the Erasmus+ programme, and their growth and recognition may evolve in subsequent programme years. It is necessary to continue evaluating their growth in the next editions of the ESNsurvey in order to ensure these initiatives reach their full potential in benefiting higher education students.

To complement, it is important to address ESNs’ Contribution to the new Learning Mobility Framework, and the complementary data on the last Eurobarometer “Youth and Democracy in the European Year of Youth”, considering that one in five young people is not aware any EU-funded opportunity to stay aboard, and regional and local levels are even less prone to receive any information and guidance on learning mobility and grant availability (Eurobarometer, 2022).
Funding of the mobility period

In our analysis, it's equally crucial to comprehend the funding opportunities of our non-mobile students who aspire to participate in mobility programmes (n=2830). The results reveal a diverse range of financial needs. Approximately 33% of respondents indicate a requirement for funding that covers between 50% to 75% of their total mobility costs. Following closely, 31% express the need for substantial support, seeking funding that covers between 75% and 100% of their expenses. About 24% need funding to cover between 25% and 50% of their mobility expenses. A smaller group, comprising 7% of respondents, anticipate needing less than 25% of their total costs covered to embark on their mobility journey. Encouragingly, 5% of respondents report being entirely funded for their upcoming mobility opportunities.
Barriers to participate in mobility

Understanding the challenges that hinder non-mobile students from participating in international student mobility programmes is pivotal for fostering inclusivity in the internationalisation of higher education. Among these non-mobile respondents (n = 3064) are both students who have the intention to partake in some type of international mobility in the coming years (n = 2333) and students who do not (yet) have the intention to go on mobility (n = 449). Another part of the respondents did not indicate whether they had this intention or not (n = 282). In what follows, an elaboration will be made on each of the barriers encountered by non-mobile students.

Figure 35: If you were to go abroad, what level of funding would be needed for your mobility period? Please consider "total cost" to include accommodation, travel and subsistence
The findings show that institutional barriers, such as those described in the SIEM research report, are the biggest barrier to mobility. Financial constraints emerge as the main barrier to participating in student mobility, with an average score of 3.96. The data underscore the pronounced impact of tuition fees, living expenses, and travel costs as obstacles that influence non-mobile students' contemplation of joining mobility initiatives. Language-related challenges, encompassing difficulties in communication in the host country's language, manifest as moderate barriers with an average score of 2.71. Cultural differences are, on average (M = 2.11), not perceived as a main barrier to participation in international mobility. Last, lack of access to support mechanisms, encompassing academic materials and services in the host country, is indicated as a barrier with an average score of 3.04. Ensuring comprehensive and readily available resources for students’ academic journey abroad assumes significance in alleviating this concern. Addressing financial concerns through accessible scholarships, grants, or financial aid becomes a crucial avenue for widening participation.
5. Participation in mobility as a reinforcer of European Identity

Before and After Mobility – Identity of Erasmus+ Students’ Citizenship

Considering that the Erasmus+ Programme aims to promote European identity, the exchange students were surveyed on their perception of their identity before and after their mobility experiences.

Before embarking on their mobility journey, 37% of ESNsurvey participants identified strongly with their hometown/city, region, and country. Simultaneously, 37% felt like citizens of the world, 38% considered themselves citizens of Europe, and 35% felt connected to the European Union.

Upon returning from their mobility experiences, these identity perceptions have shifted. While 32% reported agreeing with being citizens of their hometowns/regions, a notable 40% strongly agreed with being citizens of their own countries. Furthermore, a substantial 48% strongly...
agreed with feeling like citizens of the world, 50% identified strongly as citizens of Europe, and 47% strongly associated themselves with the European Union.

Of particular significance is the increase in the sense of being citizens of Europe and the European Union when compared to previous surveys. In 2021, only 33.05% strongly agreed with being citizens of Europe, increasing to 50% in the current ESN survey edition. Similarly, the percentage of those strongly agreeing with a sense of belonging to the European Union has risen from 33% in the past to the current 47%.

These findings underscore the transformative power of mobility experiences, which not only broaden horizons and enrich personal growth but also foster a stronger sense of European identity and unity among participants.

As the European Parliament Elections approach, our exchange students were surveyed on their motivations to vote in the near-term European Parliament elections (n=11260). After analysing the results, 66% are motivated to do so, with 45% being extremely likely and 21% likely to vote. Notably, 13% remain undecided. It’s worth highlighting that ESN, under the EGiA (Erasmus Generation in Action) Project, will support mobile voters abroad in understanding
their voting rights and processes. This initiative aims to empower Erasmus students to actively participate in the democratic process and ensure their voices are heard in the European Parliament elections.

6. First Conclusions

Under the theme of making mobility a reality for all, the XVESNSurvey draw our attention to the student perspective on international mobility. This first analysis of the results intended to access the key points for making international mobility more accessible and impactful while focusing on topics such as the priorities of the programme, the support given by the Higher Education Institutions, the funding mechanisms, the automatic recognition of credits and the European identity of mobile citizens. During this report, we also accessed the first results regarding the full-degree students and understood the motivations and barriers for non-mobile students to go abroad. In the final report, published in December, a more comprehensive analysis it’s expected, where also will be highlighted comparisons with the previous survey editions (and programme editions), other ESN projects and European policies.

Taking this into account, these are the first conclusions taken by the XV ESNsurvey:

- **Mobile students**
  - **Priorities of the Erasmus + Programme**: the student’s perspective on programme inclusion has increased, particularly while facing the inclusion top-ups. In fact, an average of 50% of respondents agreed that the inclusion measures are being well implemented by the Erasmus+ programme;
  - **Pre-departure support**: access to information it’s crucial for students, 82% of the respondents asked for more financial support in the pre-departure moment;
  - **Means of transport used during the mobility**: flying is still the most popular means of transportation to arrive to the mobility destination, with 73% and 72% of the respondents using it as the method of transport to arrive and depart from mobility. Although it’s important to highlight that bus is the preferred method for trips during mobility;
○ **Challenges faced by the students:** the XV ESNsurvey’s findings show significant similarities to the XIV ESNsurvey, where lack of funding, problems finding affordable accommodation and difficulties with matching courses reported to be the main problems faced by students.

○ **Satisfaction with hosting and sending universities:** students are reportedly satisfied with the services provided by the Higher Education Institutions, although by comparing to the previous XVI ESNsurvey, the percentage of dissatisfied has increased both with the sending and hosting institutions.

○ **Timely payment of the grants:** by comparing with previous data, it is clear that more students are now obtaining the grants on time, with an increase from 32.92% to 36.8%. Although, there are necessary improvements to be made in order to continuously support the students.

○ **Digitalisation:** students who did not have access to online processes were dissatisfied with the administration of their mobility experience.

○ **Recognition of credits:** it is important to highlight that 42% of students reported courses to be changed during the exchange. This emphasises the continuous need to maintain automatic credit recognition for exchange students.

- **Full-degree students**
  ○ **Funding of the experience aboard:** 38.9% of respondents self-funded their international experience, while 21.8% claimed that funding for 75% to 100% of their expenses was actually provided to them. This distinction emphasises an important gap in funding opportunities among full-degree students;

  ○ **Recognition of credits:** significantly more than 45% of respondents said they face difficulties getting their degrees recognised. Although it’s important to highlight that 45% of respondents did not encounter any difficulties with degree recognition after mobility.

- **Non-mobile students**
  ○ **Motivations to participate in the mobility:** similarly to the other target audiences with 37% and 43%, respectively, of non-mobile students agreeing
and strongly agreeing that "hearing from students who have been abroad" would motivate them to take the step and participate in a mobility abroad.

○ **Knowledge of the Erasmus+ initiatives:** it became clear that Erasmus+ for studies remains the most well-known, with a staggering 95%. The International Credit Mobility program and Erasmus+ Traineeships, both identified by 58% and 35% of respondents, respectively, came next. However, programs like the Blended Intensive Programme (9%) and the Erasmus Mundus Joint Masters (27%, 18%, and 18% respectively, tend to be underrepresented in the understanding of higher education students.

○ **Barriers to participate in mobility:** financial restrictions appear as the biggest obstacle to participation in student mobility.

- **Students as multipliers of European values**
  
  ○ **Identity before and after the mobility experience:** before the beginning of their mobility adventure, 37% of ESN survey participants strongly associated with their hometown/city, region, and nation, while after the mobility a significant 48% strongly agreed with feeling like global citizens, 50% strongly identified as European citizens, and 47% strongly identified with the European Union.

  ○ **Intentions to vote in the next European Parliament elections:** mobile students are highly engaged in the European Elections with 66% showing intention to vote, with 45% highly likely and 21% probable.
